

Fig. S8:

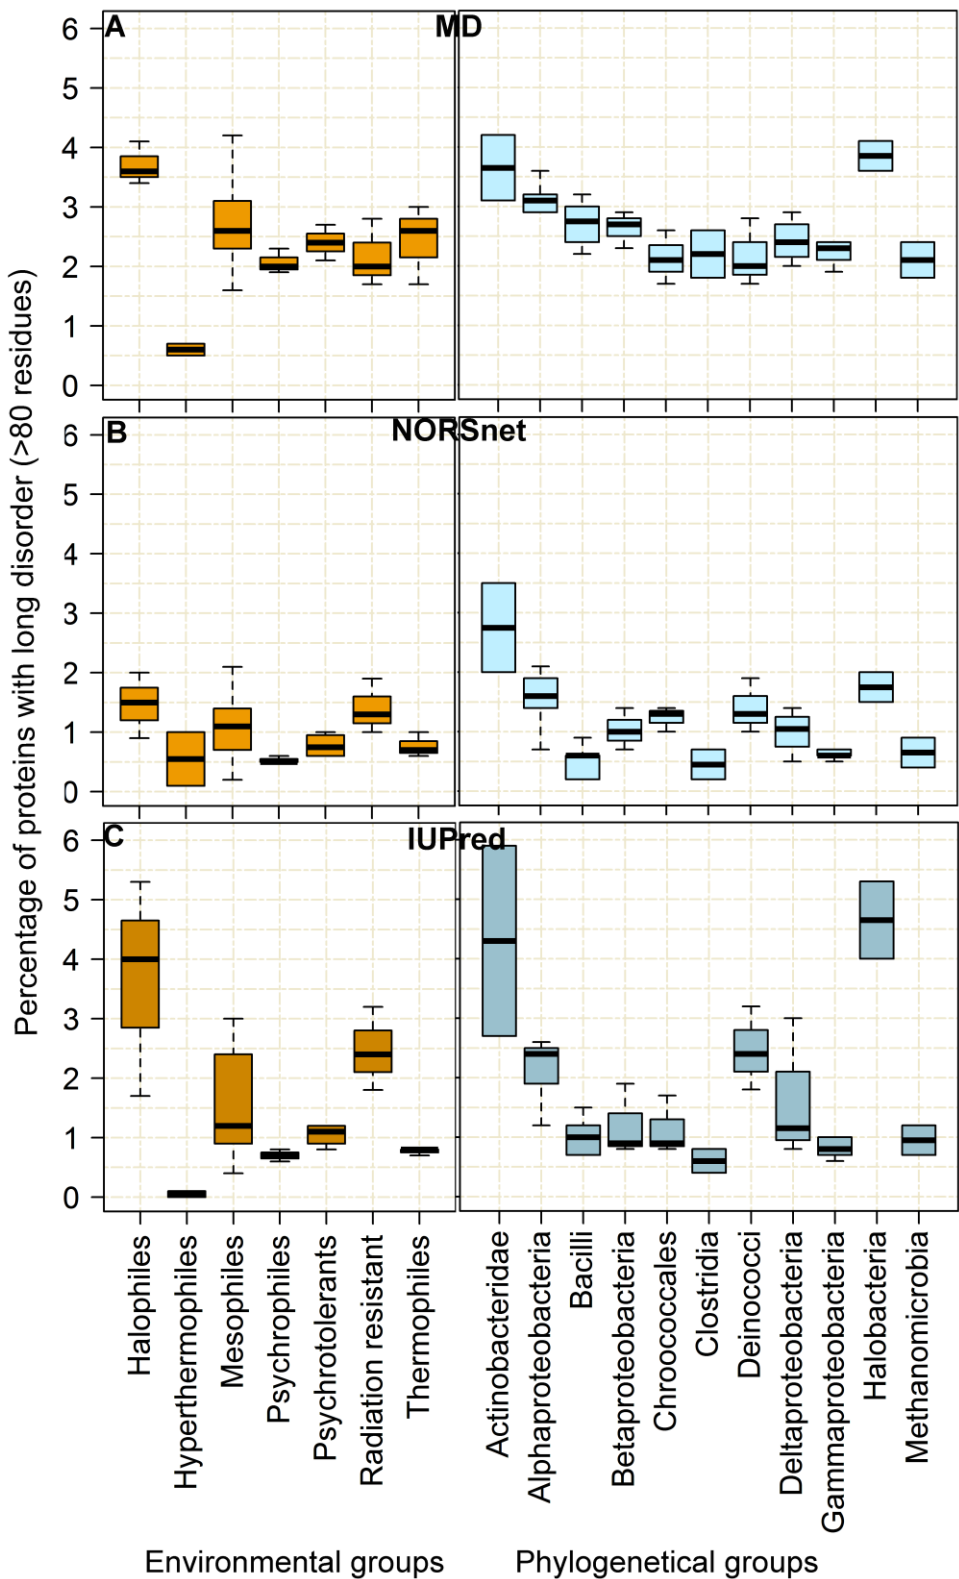

Fig. S8: Protein disorder content by environment or phylogeny for %long80. We represent the protein disorder content for the organisms in the same environment (environmental groups: A, B and C left side) and those close in terms of evolutionary relation (phylogenetic groups: A, B and C right side). The y-axes give the percentage of proteins with at least one region of ≥ 80 consecutive residues predicted as disordered by MD (A), NORSnet (B) and IUPred (C). The x-axis on the left side marks the different environmental groups (Table S2) and on the right side marks the studied phylogentic groups (Table S14).
